

Metal Mount Pads & Universal Parts

Dura Temp's metal mount series pads (MM/CM) are comprised of DT-2 silicone composite material molded around a metal reinforcing insert. These metal reinforced pads come standard on all of Dura Temp's quick-change pockets. They are crash resistant, easy to change, and available for sweepouts moving ware in either a right or left direction.

Dura Temp's most popular metal mount pad, the CM 262, is enhanced with a long metal insert to increase strength and durability which prevents damage during jams and crashes.

Numerous other straight and curved fingers are offered for customized arrangements in sweepout and transfer applications. For example, the SP 1180 S (pictured above) is also commonly employed by glass-makers running taller ware as it can be used to steady the containers .

Dura Temp also continues to offer its universal parts system. Although the universal parts mounting system has been replaced by sweepout molded pockets and the MM/CM series pads, the molded UP pads and brackets are still available upon request.
